For Immediate Release – June, 2010

Commercial building owners now have an even faster and cheaper way of electronically managing their asset's operations and maintenance information following the launch of new software by facility management consultancy firm Grazer.

Filed for international patent, the new 'C Rapid' system will be integrated into Adelaide-based Grazer's existing software solution which enables commercial infrastructure owners to manage their built assets digitally, rather than relying on hard copy manuals.

Grazer Chief Executive Officer Craig Cowling said the company's ability to deliver a fully configured knowledge management system is now more efficient than ever.

"Our software solution is continually evolving to meet client requirements, with the latest C Rapid advancement making it possible for the company to deliver an even faster and cheaper service to clients," he said.

"This latest addition to our technology suite removes the need for weeks of manual configuration work by automatically locating assets on technical drawings and linking all related knowledge to that asset, delivering a superior knowledge management solution at reduced cost," he said.

"Grazer leads the way in built asset management solutions and the new C Rapid software is another example of our commitment to helping clients save time, manage risk and minimise costs."

Designed to replace paper-based O&M manuals, Grazer's digitised products are engineered for quick information delivery and asset maintenance and can be tailored for a range of industries, including the construction, property, mining, health, defence and energy sectors.

Federation Square in Melbourne and the new SA Water building in Adelaide are among key infrastructure projects across Australia that have already replaced hard copy O&M manuals with Grazer's new software to record and store technical asset information.
